

Curriculum Vitae

Basic Information

Name: Chen Ziyang
Email: ziyangchen189@gmail.com
Phone: 15210350949

Education Background

2019.09-2022.06 | M.S. in Innovative Design of Information Products | Beijing University of Posts and Telecommunications

Core Courses: Human-Computer Interaction, Interaction Design Workshop, Usability Testing Techniques, User Experience Metrics and Experiments

GPA: 4.26/5.0 | Average Score: 84.2/100

2014.09-2018.06 | B.S. in Computer Science and Technology | Henan Normal University

Core Courses: C Language, JSP Programming, XML Fundamentals, Computer Principles, Linux

GPA: 3.29/5.0 Average Score: 78.5/100

Research Interests

- Collaborative mechanisms of AI in the product design process
- Human-AI co-creation strategies and perceptual adaptation issues
- Special focus on the controllability of generative content, multimodal interaction experience design, and the explainability of AI systems

Work experience

2024.03-Present | Zibuyu Studio | Founder

- Established an independent design studio to explore the potential of AI technology throughout the entire product design lifecycle. To validate this concept, I led the design and development of a WeChat Mini Program from scratch.
- In this project, I was not only responsible for traditional design and development but also treated it as an exploratory practice to test the feasibility and challenges of AI in assisting with requirement analysis and generating design elements.

2022.06-2024.03 | Meituan | Interaction Designer

- Led the user experience design for Meituan Kuailv's B2B products, driving product iterations using mixed research methods such as qualitative interviews and quantitative analysis (e.g., user satisfaction, customer effort score).
- Conducted in-depth research on the digital interaction patterns of users with low digital literacy and proposed adaptive design strategies, which were successfully implemented in the final launched solution.

2020.11-2021.05 | Tencent | Product Design Intern

- Participated in the proof-of-concept and product incubation for the "AI Red Packet" project, focusing on translating cutting-edge AI capabilities (such as visual/action recognition) into an understandable and trustworthy user experience.
- Explored the impact of AI systems on user behavior in engaging scenarios by designing various interactive tasks and feedback mechanisms.

Project Experience

Project 1 | Accessibility (Age-Friendly) Design for Meituan Kuailv Partner App | 2023.2 - 2023.7

- **Role:** Interaction Designer
- **Background:** A significant portion (65%) of the partners were middle-aged and elderly users with generally low levels of education, facing high operational barriers due to the complex and information-dense management mini-program.
- **Responsibilities:** Identified key pain points of information overload and complex user flows through user interviews and competitive analysis. Proposed and led the implementation of a design strategy focused on "feature simplification + information hierarchy optimization + user flow visualization."
- **Outcomes:** Achieved a 21% increase in task completion rate and a 30% reduction in customer effort score, providing an empirical case for age-friendly design.

Project 2 | Tencent WXG "Happy AI Red Packet" Design | 2022.7-2022.9

- **Role:** Product Design Intern
- **Background:** An exploratory project aimed at validating user perception and acceptance of emerging AI capabilities in real-world social contexts.
- **Responsibilities:** Designed a variety of interactive challenges based on AI capabilities like expression recognition and pose estimation provided by the team. The designs included expression contests, action imitation, and image recognition, emphasizing immediate and motivating task feedback.
- **Outcomes:** The project was successfully launched and completed initial user validation, confirming the positive effect of gamification in improving user tolerance for AI system errors and enhancing trust.

Project 3 | HOME: A Food-as-Medium Service System for Affective Connection | 2020.5 - 2020.6

- **Role:** Project Lead
- **Background:** A service design study (graduate course project) aimed at bridging the intergenerational emotional gap, exploring how to build sustained family connections through the everyday medium of food.
- **Responsibilities:** Developed a socio-technical system including a digital app and a physical kitchen tutorial component. Completed the service blueprint and the interaction design for key interfaces.
- **Outcomes:** The design was shortlisted for the Red Star Design Award and systematically demonstrated how to materialize the abstract emotional needs of family members through design, providing a paradigm for building "trust" and "emotional connection" in digital services.

Personal skills

- Tools: Figma, Ps (Photoshop), Ai (Illustrator), Axure, SQL, Visio
- Programming: Python/Java (for basic development & logical thinking)
- Research Methods: User Interviews, User Behavior Analysis (including Customer Effort Score analysis, path tracking, A/B testing)
- Languages: CET-6, IELTS 6.5

Self-evaluation

I don't see research as merely "filling knowledge gaps," but as "designing better interactive relationships." I don't emphasize "I understand AI"; instead, I'm curious about: "Are people willing to trust AI?", "How should a system persuade its users?", and "Should the collaboration maintain a degree of ambiguity?"

If this is what you're researching—we're a match.
